(Effect)

The antiallergic and anti-inflammatory activities of the benzothiazolinone derivative (I) of the invention
 are described below.

Test Example 1

Antagonism to passive cutaneous anaphylaxis (P.C.A.) in rat:

Test method

Antiserum was prepared by the following method. One mg of egg albumin emulsified in 0.5 ml of
 Diphtheria-Pertussis-Tetanus Combined Vaccine (Tanabe Seiyaku Company Ltd.) and 0.5 ml of Freund's
 incomplete adjuvant (Seikagaku-Kogyo Company Ltd.) was used as the rat reagenic antiserum antigen
 against egg albumin. The emulsion was given subcutaneously in a single dose of 1 ml divided equally (0.25
 ml) to the four foot pads of male SLC Wistar-strain rats aged 7 weeks, each weighing 170 to 190 g. Blood
 samples were collected 12 days after injection and centrifuged at 3000 r.p.m. at 4°C for 15 minutes. The
 antisera thus obtained were stored at -20°C.

Groups consisting of five SLC Wistar-strain rats weighing 150 to 170 g were used. The rat reagenic
 antiserum against egg albumin was used at a dilution 1:4. The animals were sensitized with 0.1 ml of the
 antiserum injected intracutaneously on the depilated backs of the rats. Forty-eight hours after the injection of
 the antiserum, 1 ml of the mixture of egg albumin (5 mg) and Evan's blue (5 mg) in physiological saline (1
 ml) was injected intravenously to cause the P.C.A. reaction. Thirty minutes after the injection of the antigen,
 animals were sacrificed and the skin was removed. The blue spots which occurred due to the P.C.A. reaction
 were measured their long and short diameters and the areas of the spots were found from the average of
 the values of the diameters. Each test compound was given orally with 16 mg/kg and intravenously with 4
 mg/kg, 1 hour and 5 minutes before injection for P.C.A. reaction respectively. The reaction inhibitory ratio of
 the group administered the test compound was calculated from the ratio of the areas of the control group
 and the group administered the test compound. Test compounds are as follows.

Compound A: 3-[1-(5-chloro-2-oxobenzothiazolin-3-yl-acetyl)piperidin-4-yl-oxycarbonyl]propionic acid,
 Compound B: 5-chloro-3-(4-ethoxycarbonyloxypiperidinocarbonylmethyl)benzothiazolin-2-one,
 Compound C: 5-chloro-3-[4-(N-ethylcarbamoyloxy)piperidinocarbonylmethyl]benzothiazolin-2-one, and
 Compound D: 5-chloro-3-[4-(N,N-dimethylcarbamoyloxy) piperidinocarbonylmethyl]benzothiazolin-2-one.

Test results

The results are shown by the following Table 1.

Table 1

5	[P.C.A. reaction inhibitory ratio of rat (%)]		
	Test compound	Oral administration	Intravenous administration
	A	50.9	42.2
	B	50.7	44.2
	C	45.1	41.6
10	D	40.3	47.8

Test Example 2

15 Antagonism to acute edema at sole of hind leg in rat:

Groups consisting of five SLC Wistar-strain rats weighing 150 to 170 g were used.

Each test compound was given orally with 200 mg/kg and intravenously with 64 mg/kg, 30 minutes and five minutes respectively before subcutaneous injection of a prophlogistic substance (1 ml of 1% λ -carrageenin solution) into the sole of one hind leg. A volume of the sole was measured with time. The
 20 edema ratio of sole edema was calculated in comparison between the volumes of the sole before and after injection of the prophlogistic substance. The inhibition ratio was calculated from the difference of the edema ratio between the substance administered group and the control group.

25 Test compounds

The compounds A and C in the test example 1 were used.

Results

30

The results are shown by the following Table 2.

Table 2

35	Inhibitory ratio (%) of sole edema in rat					
	Administrating route	Oral			Intravenous	
	Measuring time (hr.)	1	2	3	1	2
	Compound A	24.5	62.3	69.4	83.2	24.2
40	Compound C	-	-	-	64.9	52.9
